## WP3: Task 3.3: Uncertainty estimation

Report on Uncertainty Estimation for Digital Measurements of Voltage Waveforms

19/05/2022

Madrid, Spain

# Objectives of the report

- Evaluate the sources of uncertainties in digital measurement of waveforms
- Calculate uncertainty propagation for the whole traceability chain
- Provide models and approaches for fast on-site calculations of uncertainties

Uncertainty estimation is based on:

- Measurement procedures
- Algorithms used to obtain measurement parameters
- Uncertainty sources
- Current measurements are also based on voltage measurements

For these reasons the report is planned as follows:

# Content of the report

- Detailed instructions on measurement procedure for **voltage** are presented. Including
  - Including equipment/systems which are available in the market
  - Possible measurement setups
  - Explanation of the calibration process which defines with which setup/configuration to use which algorithm
  - Presents ideas for choosing references to be used to reach the uncertainty goals.
  - Briefly steps of calibration for both voltage sampler and voltage source calibration are defined.
- Model functions of the measurements are given in detail including the uncertainty sources and their estimated values.
- Finally information about uncertainty calculations and
- The scope of the measurements is presented

# Content of the report-Measurement Setups

## Measurement Setups-Advised Algorithms for Waveforms with Single Tones

**Table-1. Methods/Algorithms for Calculating Effective Value of Single Tone Voltage Waves**

Measuring-Setup $\alpha$	Sampler $\alpha$	RMS-formula $\alpha$	Discrete-Fourier-Transform $\alpha$	3-Parameter-Sine-Fitting $\alpha$	4-Parameter-Sine-Fitting $\alpha$
Synchronous $\alpha$	IADC $\alpha$	$\checkmark \rightarrow \alpha$	$\checkmark \rightarrow \alpha$	$\checkmark \rightarrow 5\alpha$	$\checkmark \rightarrow 6\alpha$
	$\Delta\Sigma$ -ADC $\alpha$	$\checkmark \rightarrow \alpha$	$\checkmark \rightarrow \alpha$	$\checkmark \rightarrow 5\alpha$	$\checkmark \rightarrow 6\alpha$
	QV $\alpha$	$\checkmark \rightarrow \alpha$	$\times 4\alpha$	$\checkmark \rightarrow 5\alpha$	$\checkmark \rightarrow 6\alpha$
Semi-synchronous $\alpha$	IADC $\alpha$	$\checkmark \rightarrow 1\alpha$	$\checkmark \rightarrow 1\alpha$	$\checkmark \rightarrow 1,5\alpha$	$\checkmark \rightarrow 1,6\alpha$
Asynchronous $\alpha$	IADC $\alpha$	$\times 2\alpha$	$\times 3\alpha$	$\checkmark \rightarrow 7\alpha$	$\checkmark \rightarrow 8\alpha$
	$\Sigma\Delta$ -ADC $\alpha$	$\times 2\alpha$	$\times 3\alpha$	$\checkmark \rightarrow 7\alpha$	$\checkmark \rightarrow 8\alpha$

- 1- Half of the CLK period of the ADC should be considered as the jitter parameter.
- 2- Samples may not represent a whole period, as it may not be an integer when the sampling ( $f_s$ ) frequency of the sampler (ADC) is divided to the frequency of the source ( $f_m$ ). Therefore, instability between measurements may be high.
- 3- The window effect should be evaluated, as the ratio obtained when the sampling ( $f_s$ ) frequency of the sampler (ADC) is divided to the frequency of the source ( $f_m$ ).
- 4- Samples will not be evenly spaced in time domain when the QV's sampler is the NI5922.
- 5- Fitting frequency should be taken  $f_m = f_s/N$
- 6- Starting frequency should be taken  $f_m = f_s/N$
- 7- When  $f_m$  and  $f_s$  are determined according to the same frequency standard and time data of the sampler is corrected according to the frequency measurement result, the algorithm gives results with high accuracy. The amount of data must be greater than one period.
- 8- This algorithm can be used when  $f_m$  is too small to be measured with a frequency counter. There must be at least five periods of data. When  $f_m$  is estimated correctly, the signal-to-noise ratio of the fitted curve ( $SNR = 10 \cdot \log \left( \frac{V_{RMS,D}^2}{P_{Error}} \right)$ ) is calculated within expected values. If the SNR is worse, by trying different starting frequencies for  $f_m$ , iteration should be continued for the lowest SNR.

## Measurement Setups-Advised Algorithms for Multi Tones

**Table 2. Methods/Algorithms for Calculating Effective Value of Each Tone of Multi-Tone Voltage Waves.<sup>1¶</sup>**

Measuring Setup $\alpha$	Sampler $\alpha$	Discrete-Fourier-Transform $\alpha$	3-Parameter-Sine-Fitting $\alpha$	4-Parameter-Sine-Fitting $\alpha$
Synchronous $\alpha$	IADC $\alpha$	$\checkmark \rightarrow 2\alpha$	$\checkmark \rightarrow 3\alpha$	$\checkmark \rightarrow 3\alpha$
Synchronous $\alpha$	$\Delta\Sigma$ -ADC $\alpha$	$\checkmark \rightarrow 2\alpha$	$\checkmark \rightarrow 3\alpha$	$\checkmark \rightarrow 3\alpha$
Synchronous $\alpha$	QV $\alpha$	$\times \alpha$	$\checkmark \rightarrow 3\alpha$	$\checkmark \rightarrow 3\alpha$
Semi-synchronous $\alpha$	IADC $\alpha$	$\checkmark \rightarrow 2\alpha$	$\checkmark \rightarrow 3\alpha$	$\checkmark \rightarrow 3\alpha$
Asynchronous $\alpha$	IADC $\alpha$	$\times \alpha$	$\checkmark \rightarrow 4\alpha$	$\checkmark \rightarrow 5\alpha$
Asynchronous $\alpha$	$\Sigma\Delta$ -ADC $\alpha$	$\times \alpha$	$\checkmark \rightarrow 4\alpha$	$\checkmark \rightarrow 5\alpha$

1- The footnotes given in Table 1 are taken into account. ¶

2- Tones must be harmonics of  $f_m$  ( $k \times f_m$ ,  $k=0, 1, 2, 3, \dots$  ve  $k \times f_m < f_s/2$ ). ¶

3- Tones  $f_k = k f_s / (M.N)$ ;  $-k=0, 1, 2, 3, \dots$  ve  $f_k < f_s/2$ . ¶

4-  $f_k$  frequencies must be estimated/measured correctly. ¶

5- Footnote (8) in Table 1 should also be taken into account for  $f_k$  frequencies.  $\alpha$

## Model Functions & Uncertainty Sources

The model function of an  $x[n]$  sample is defined:

$$x[n] = V_J + \frac{1}{T_i + \delta_{JT_i}} \left( 1 + \delta_{REF} + \delta_G + \frac{\delta_{LIN} + \delta_{RES}}{|V_{ADC}|} V_{FS} \right) \int_{v.T_a + \delta_{JT_a}}^{v.T_a + \delta_{JT_a} + T_i + \delta_{JT_i}} \{v_i(t) + v_s(t)\} \cdot dt + v_{sn}(t)$$

**Table 4.** Uncertainty Components

Component	Definition and Its Value	Probability-Distribution-Function	Uncertainty	Correlation-Between-Samples
1	$V_J$ <ul style="list-style-type: none"> <li>Quantum voltage of the <math>n^{th}</math> sample when the sampler is QV</li> <li>Its value is zero when sampler is 3458A, <math>\Sigma\Delta</math>-ADC, ADC</li> </ul>
